— WHAT IT IS

Sijil seals a tamper-evident record of every LLM inference — model version, execution node and location, policy in force, approval reference, input and output hashes — on infrastructure the customer owns. An independent verifier proves the chain is unbroken. The output is an audit report an assurance function can hand to a third party.

— WHAT YOU SAW TODAY

1.3 ms Added latency per call, p95	<1 min Install to first sealed record	750 KB Storage per 1,000 records	0 Changes to model, app or runtime	A record edited outside the app — even with its hash correctly recomputed — is named by sequence number by a verifier that shares no code with the writer.
--	--	--	--	--

— THE ACCOUNTS THIS IS FOR

NOT THE ONES YOU TAKE WHOLE Platform adopters Where a customer adopts your platform end to end, they get lineage and audit with it. Sijil is redundant there, and we will say so. We are channel, not competition.	THE ONES YOU CAN'T Stack owners and mixed estates Customers who built their own inference stack, or run an estate they will not replace, have no attestation path — hyperscaler confidential inference does not reach hardware they own. Nobody replaces a working stack to get an audit trail, so the requirement goes unmet and the bid gets harder. Sijil covers these accounts without displacing anything you would otherwise sell.
--	--

— WHAT IT DOES FOR YOUR BID

Fills an evidence requirement	Without asking the customer to replace their inference stack
Runs on their hardware	Bare metal, private cloud, mixed estate. No hyperscaler dependency
Sits under your delivery	You hold the customer relationship and the contract
UAE-based provider	Supports local-content and sovereignty requirements in the response

— WHAT WE NEED FROM THE ENVIRONMENT

- A network path in front of the existing model endpoint
- Read access to model version identifiers
- Storage for the record chain, on their infrastructure
- One named policy owner on the customer side

No change to the model, the application, or the serving runtime.

— WHAT WE COMMIT TO

- Technical content for the compliance and assurance sections of your response
- A named engineer through deployment
- Deployment inside your delivery, under your customer relationship
- No direct approach to the account outside the partnership

— HONEST BOUNDARIES

Sijil proves records have not been altered since sealing. It does not yet prove the sealer itself was honest, and node location is signed rather than hardware-bound. Hardware root of trust — binding the seal to the silicon — is roadmap, built on NVIDIA and TEE attestation primitives rather than replacing them. Priced per deployed model, per year. We say all of this to customers too.

— NEXT STEP

Name one live or upcoming opportunity where the customer keeps their own inference stack.

We will build the technical response section for it at no cost, before any commercial agreement.

TODAY	Working proxy, independent verifier and audit PDF. This brief.
30 DAYS	Compliance & assurance section written for your bid , free.
90 DAYS	Paid pilot on the customer's own hardware, under your delivery.
